

## Lesson 2

### Additional Mathematics A-Level Pure Mathematics : Year 1 Trigonometry IV

#### 2.1 In Disguise

Faced with an unfamiliar mathematical situation, a technique frequently deployed is to seek a way to transform it into a more familiar situation for which a method of solution is already known.

Here is a seemingly more complicated trigonometric equation to solve;

$$4 \cos^2 x + \cos x - 3 = 0 \quad \text{for } 0^\circ \leq x \leq 360^\circ$$

How might this be handled ?

Using a graphics calculator or a graph plotter would give some idea of the situation in which the problem is embedded.

Where does this (red piece of) graph have zero height ?

It would seem that there is one solution around  $45^\circ$ , another around  $315^\circ$ , and possibly one or two more close to  $180^\circ$  although it's not clear if the curve gets to or crosses the  $x$ -axis near  $180^\circ$ .

Of course, what is sought is a mathematical method of solving the trigonometric equation which the teaching video will now reveal,

## 2.2 Exercise

*Any solution based entirely on graphical or numerical methods is not acceptable*

Marks Available : 30

### Question 1

The graph is of the trigonometric equation,

$$f(x) = 2 \sin^2 x + \sin x - 1$$

with a focus on the red piece on the interval  $0^\circ \leq x \leq 360^\circ$

- (i) From looking at the graph, write down the possible approximate values of  $x$  that would satisfy the equation

$$2 \sin^2 x + \sin x - 1 = 0, \quad 0^\circ \leq x \leq 360^\circ$$

[ 4 marks ]

- (ii) Use the mathematics of a *quadratic in disguise* to solve the equation

$$2 \sin^2 x + \sin x - 1 = 0, \quad 0^\circ \leq x \leq 360^\circ$$

[ 6 marks ]

### Question 2

The graph is of the trigonometric equation,

$$f(x) = 2 \cos^2 x - 3 \cos x + 1$$

with a focus on the red piece on the interval  $0^\circ \leq x \leq 360^\circ$

- (i) From looking at the graph, write down the four approximate values of  $x$  that would satisfy the equation

$$2 \cos^2 x - 3 \cos x + 1 = 0, \quad 0^\circ \leq x \leq 360^\circ$$

[ 4 marks ]

- (ii) Use the mathematics of a *quadratic in disguise* to solve the equation

$$2 \cos^2 x - 3 \cos x + 1 = 0, \quad 0^\circ \leq x \leq 360^\circ$$

[ 6 marks ]

### Question 3

The graph is of the trigonometric equation,

$$f(x) = 15 \sin^2 x - 11 \sin x + 2$$

with a focus on the red piece on the interval  $0^\circ \leq x \leq 360^\circ$

It's not clear from the graph how many, if any, solutions there are as the minimum points could be above or below the  $x$ -axis.

By viewing the following equation as a *quadratic in disguise* find the solutions, if there are any, to the equation

$$15 \sin^2 x - 11 \sin x + 2 = 0, \quad 0^\circ \leq x \leq 360^\circ$$
