#### Lesson 6

## Further A-Level Pure Mathematics : Core 1 Roots of Polynomials

#### **6.1 Test Preparation**

Gerolamo Cardano's first step in solving the general cubic equation was to make a substitution that turned it into a depressed cubic equation.

#### **Depressed Cubic Formation Rule**

Faced with a general cubic,

 $a x^{3} + b x^{2} + cx + d = 0$  *a*, *b*, *c*,  $d \in \mathbb{C}$ initiate a change of variable by replacing *x* with  $t - \frac{b}{3a}$ 

This will always result in what is termed a depressed cubic, one of the form,

 $t^3 + pt + q = 0 \qquad \qquad p, q \in \mathbb{C}$ 

The depressed cubic equation has some useful properties one of which shall now be studied, as it has a beautiful proof.

## 6.2 Sum of Cubes for a Depressed Cubic

#### Sum of Cubes for a Depressed Cubic

For a depressed cubic.

$$t^3 + pt + q = 0 \qquad p, q \in \mathbb{C}$$

with roots  $\alpha$ ,  $\beta$  and  $\gamma$ 

 $\alpha^3 + \beta^3 + \gamma^3 = 3\alpha\beta\gamma$ 

Proof

As there is no term in 
$$t^2$$
,  $\alpha + \beta + \gamma = 0$   
 $\therefore \alpha + \beta = -\gamma$ 

Cube both sides

$$(\alpha + \beta)^{3} = -\gamma^{3}$$

$$\alpha^{3} + 3\alpha^{2}\beta + 3\alpha\beta^{2} + \beta^{3} = -\gamma^{3}$$

$$\alpha^{3} + \beta^{3} + \gamma^{3} = -3\alpha\beta(\alpha + \beta)$$

$$\alpha^{3} + \beta^{3} + \gamma^{3} = -3\alpha\beta(-\gamma)$$

$$\alpha^{3} + \beta^{3} + \gamma^{3} = 3\alpha\beta\gamma \qquad \Box$$

#### 6.3 Exercise

Any solution based entirely on graphical or numerical methods is not acceptable. Make the method used clear. Marks available : 50

#### **Question 1**

The roots of the quadratic equation  $ax^2 + bx + c = 0$  are  $\frac{-3 \pm 4i}{2}$ Find integer values for *a*, *b* and *c* 

#### [ 3 marks ]

#### **Question 2**

The roots of the equation  $ax^4 + 7x^3 + 5x^2 + 3x - 4 = 0$  are  $\alpha, \beta, \gamma$  and  $\delta$ (**a**) Given that  $\alpha\beta\gamma\delta = -1$ , write down the value of a

#### [1 mark]

(**b**)  $\sum \alpha\beta$  is (sloppy) shorthand for "sum of the product pairs of roots". For a quartic  $\sum \alpha\beta = \alpha (\beta + \gamma + \delta) + \beta (\gamma + \delta) + \gamma (\delta)$  $= \alpha\beta + \alpha\gamma + \alpha\delta + \beta\gamma + \beta\delta + \gamma\delta$ 

Write down the values of  $\sum \alpha$ ,  $\sum \alpha \beta$  and  $\sum \alpha \beta \gamma$ 

#### [3 marks]

(c) Hence find the value of  $a^2 + \beta^2 + \gamma^2 + \delta^2$ 

[ 3 marks ]

Further A-Level Examination Question from May 2018, IAL, F1, Q7 (Edexcel)

It is given that  $\alpha$  and  $\beta$  are roots of the equation  $5x^2 - 4x + 3 = 0$ Without solving the equation,

(**a**) find the exact value of 
$$\frac{1}{\alpha^2} + \frac{1}{\beta^2}$$

[ 5 marks ]

(**b**) find a quadratic equation which has roots  $\frac{3}{\alpha^2}$  and  $\frac{3}{\beta^2}$  giving your answer in the form  $ax^2 + bx + c = 0$ , where *a*, *b* and *c* are integers.

(i) For the general cubic,  $ax^3 + bx^2 + cx + d = 0$ , write down from memory the formula for  $a^3 + \beta^3 + \gamma^3$ 

[ 2 marks ]

(ii) Show that your part (i) formula yields the same expression as proven in section "6.2 Sum of Cubes for a Depressed Cubic" when b = 0 in the general cubic equation.

[ 2 marks ]

(iii) Consider the cubic equation,

$$x^3 + 3x^2 + 50 = 0$$

Using a suitable substitution, transform this into a depressed cubic.

[ 2 marks ]

(iv) By thinking of  $\alpha^3 \beta^3 + \beta^3 \gamma^3 + \gamma^3 \alpha^3$  as  $P^3 + Q^3 + R^3$  and using the same formula as in part (i) derive a formula for  $\alpha^3 \beta^3 + \beta^3 \gamma^3 + \gamma^3 \alpha^3$ with component parts that are either  $\alpha + \beta + \gamma$  or  $\alpha\beta + \beta\gamma + \gamma\alpha$ or  $\alpha\beta\gamma$ .

[ 4 marks ]

(v) Let  $\alpha$ ,  $\beta$  and  $\gamma$  be the roots of your part (iii) depressed cubic. Without solving the equation find a cubic with roots,  $\alpha^3$ ,  $\beta^3$  and  $\gamma^3$ in the form  $w^3 + pw^2 + qw + r$  where p, q and r are integers.

 $f(x) = mx^3 + 12x^2 + 4x + 16$  where *m* is a real constant Given that,

• *f* has at least one root on the imaginary axis Solve completely,

$$f(x) = 0$$

Prove that the roots of  $x^3 + px + qx + r = 0$  form an Arithmetic Progression if and only if  $2p^3 + 27r = 9pq$
